NCE Project No. 450.10.55

Executive Summary

Nichols Consulting Engineers, Chtd. (NCE) was selected by Santa Cruz County to update the Pavement Management Program (PMP) using an automated survey on entire County's maintained network. The purpose of the PMP is to help educate policymakers about the current condition of the road network and the impact of various scenarios on future network conditions. This report summarizes the findings from the 2024/25 PMP update.

The County is responsible for maintaining 582.8 centerline miles of roads which includes 8.8 centerline miles of gravel roads, representing a substantial investment of approximately \$989.8 million. The road network includes 38.9 miles of arterial roads, 227.6 miles of collector roads and 307.1 miles of residential roads. In summer 2025, NCE collected pavement condition data throughout the entire network using MTC distress protocols. Survey data was entered into the StreetSaver® database, which the County uses as a decision-support tool.

Overall, the County's pavement network is currently in "Fair" condition with an average pavement condition index (PCI) of 57. Overall, 29.5 percent of the County's road network area is in "Good" condition, approximately 31.8 percent is in "Fair" condition, 35 percent is in "Poor" condition, and 3.7 percent is in "Very Poor" condition.

The budget needs analysis indicated that the County needs to spend approximately \$613.8 million over the next 10 years to bring the road network to a condition that can be maintained with on-going preventive maintenance in the most cost-effective way. To establish a pragmatic approach, 4 budget scenarios were examined using a yearly inflation rate of 3.5 percent for a 10-year analysis period. The budgeted amounts for the 4 scenarios include paving as well as general construction items such as mobilization and striping, along with staff time, design, construction management, and contingencies.

The following table summarizes each scenario and its corresponding 10-year budget, PCI, and deferred maintenance costs at the end of the analysis period.

Table A. Budget Scenario Analysis Summary

Scenario	Description	Cumulative 10-year Budget (\$M)	End of FY 34/35	
			Network PCI	Deferred Maintenance (\$M)
1	County's Existing Budget	55.0	36	682.9
2	Maintain Network PCI at 57	294.5	57	401.2
3	Improve Network PCI to 70	490.8	70	197.5
4	Major Roads (Improve PCI to 70) and Local Roads (Do Nothing)	220.2	50	482.9

NCE recommends that the County increase the funding level to improve the network condition and decrease deferred maintenance. Scenario 3 accomplishes both of these objectives by increasing PCI from 57 to 70 with a decreased deferred maintenance of \$197.5 million by the end of FY 34/35 compared to current deferred

maintenance of \$293.7 million. However, if the County determines that Scenario 3 is unrealistic to implement due to significant financial commitment, **NCE recommends that the County pursue Scenario 2 for first 3-4 years, while seeking new funding sources to improve the PCI to 70, and maintain the overall network in “Fair” condition.** It should be noted that under Scenario 2, the required total budget for next 10 years is \$239.5 million higher than the County’s Current Budget.

Appendices A through E present supporting materials for this report which include GIS PCI maps of the County’s network (Appendix A), maintenance and rehabilitation decision tree (Appendix B), budget needs (Appendix C), scenario results (Appendix D) and list of roads with PCI details in Appendix E (sorted by descending PCI and sorted alphabetically by road name).

1 Introduction and Background

The County of Santa Cruz (County) has utilized the StreetSaver[®] pavement management program (PMP)¹ since 1989 to manage its pavement network, which is composed of approximately 582.8 centerline miles of publicly maintained roads. This includes approximately 8.8 centerline miles of gravel roads in the network. Nichols Consulting Engineers, Chtd. (NCE) conducted the last PMP update in 2018. In 2024, NCE was again selected by the County to update the Pavement Management Program (PMP).

In general, PMPs are “designed to provide objective information and useful data so that managers can make more consistent, cost-effective, and defensible decisions related to the preservation of a pavement network.”² In other words, a PMP is designed to assist cities with answering questions such as:

- What does the County’s pavement network include?
- What is the current condition of the pavement network?
- What is the County’s current M&R strategies?
- How much funding is required to perform all M&R treatments needed over the next analysis period (typically 5 to 10 years)?
- What effect does the County’s existing funding have on the network condition and overall deferred maintenance³?
- What effect will other funding amounts have on the network condition and deferred maintenance?

To update the County’s PMP, NCE surveyed pavement conditions in compliance with ASTM D6433⁴ guidelines. Automated surveys were performed by two-person crews to record all pavement distresses. The surveys did not include non-pavement issues such as traffic, safety and road hazards, geometric issues, shoulders, sidewalks, curb and gutters, drainage issues, or immediate maintenance needs.

After inspection, all survey data were entered into the County’s StreetSaver[®] database, and Pavement Condition Index (PCI) calculations were performed. NCE then reviewed and updated the County’s decision tree, including maintenance and rehabilitation (M&R) strategies and treatment unit costs, analyzed the budget needs, and modeled 4 budget scenarios for the road network.

1.1 Purpose

The purpose of this report is to provide a comprehensive understanding of the overall pavement condition and facilitate effective planning and maintenance strategies for the County. The report assists policymakers in decision-making by showing the impacts of different funding strategies on the County’s roads over the next 10

¹ StreetSaver[®] is a program developed by the Metropolitan Transportation Commission (MTC) and is the most widely used PMP in California.

² AASHTO *Guidelines for Pavement Management Systems*. (Washington, DC: American Association of State Highway and Transportation Officials, 1990).

³ Deferred maintenance refers to maintenance activities that were either not performed as scheduled or were postponed to a future period due to insufficient funding. This calculation encompasses costs associated with CICM (Construction Inspection and Construction Management), design, and contingencies.

⁴ ASTM. *ASTM D6433. Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys*. (West Conshohocken, PA: ASTM International, 2023), [astm.org](https://www.astm.org).

years. It also assists the County with identifying M&R priorities specific to the County's needs and highlights options for improving the current PCI. These options are developed by conducting "what-if" analyses using StreetSaver® software.

2 Pavement Distress Data Collection

Reliable pavement data is essential for making smart, cost-effective decisions about road maintenance. High-quality information ensures that repairs are prioritized where they're needed most, resources are used efficiently, and our roads remain safe and accessible for everyone.

2.1 Pavement Condition Survey

NCE's MTC certified inspectors and testing vehicles performed comprehensive pavement condition surveys on approximately 574 centerline miles of County-maintained paved roads. The survey included an assessment of all functional classifications within the County's road network. The survey did not include gravel or private roads.

2.1.1 Automated Data Collection for Roads

Our Roadway Collection Vehicle System, which is certified by MTC, uses a 6D Dual-lane Road LiDAR Scanner that automatically collects a wide variety of pavement defects and pavement surface damage(s) using advanced laser scanning technology to capture high resolution 3D roadway surface profiles and 2D digital pavement images. As part of this survey, 100% of the length of each road segment was surveyed. For road sections with four or more lanes, NCE conducted multiple passes (at least one in each direction) to collect sufficient data.

Our system comprises many sub-components (see Figure 1 below) to provide automated, real-time, accurate, and repeatable roadway condition results, such as:

- Inspection survey distances
- Longitudinal roughness "rideability"
- Crack detection and measurement
- 2D and 3D pavement profiles
- Wheel track rutting depths and transverse profiles
- Global positioning (GPS) system integration

The pavement distress data collection process involved the use of high-resolution 3D digital imaging technology and integrated distress laser pavement roadway scanners, which allowed us to correctly quantify the type, severity, extent, start and stop points of all ASTM D6433 or MTC pavement distresses.

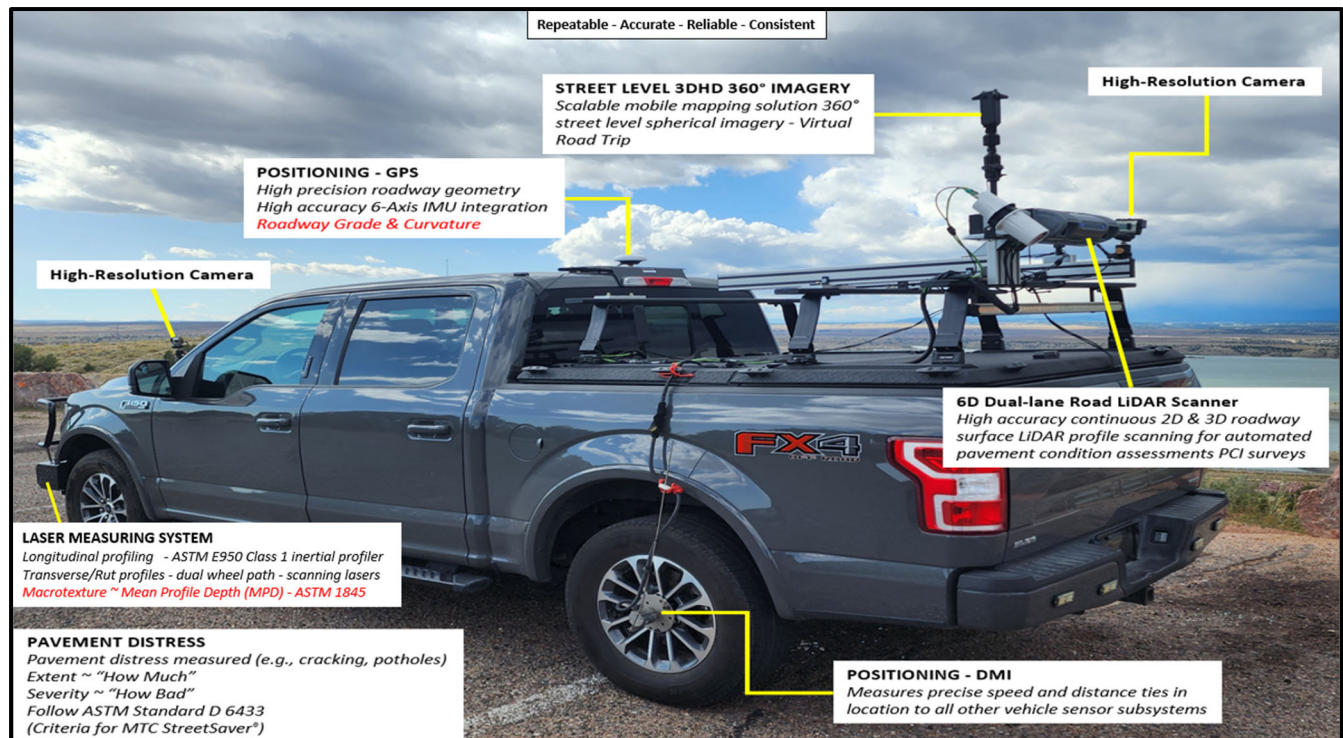

Figure 1. Roadway Collection Vehicle System.

2.2 Quality Assurance/Quality Control

Quality management practices for pavement management suggest that a one-time inspection of the final data is typically inadequate and involves a high risk of failure. We recognize the importance of effectively implementing and maintaining quality control and assurance practices for pavement distress data. We use a proven approach that integrates quality management and control procedures throughout the entire data collection and delivery process.

NCE implemented a robust, multi-step QA/QC process for all data collection activities in Santa Cruz County, including multiple data verification methods, systematic quality checks, and technical validation.

2.2.1 Multiple Data Verification Methods

To ensure accuracy, several independent methods were used to verify the pavement condition data.

- **Comparison with M&R Data:** Cross-checking distress data with recent maintenance records provided by the Santa Cruz County.
- **Historical PCI Comparison:** Typically, PCI drops by 3-5 points per year, so any sections that dropped more than that were flagged for review.
- **Desktop Review by Certified Inspectors:** Randomly selected inspections were independently reviewed by certified pavement inspectors to verify accuracy.

2.2.2 Systematic Quality Checks

NCE reviewed field procedures, compared field data with on-site conditions, and conducted random spot checks of data entry. Special attention was given to ensuring consistency between the automated road surveys and manual inspections.

2.2.3 Technical Validation

All processed data underwent final technical validation before being integrated into the PMP database. This included verification of data completeness, format consistency, and logical validation of condition values. The data collection systems were operated by certified technicians, ensuring consistency and reliability in the collected data.

2.3 Advisory Note

It should be noted that this scope of work and condition surveys did not address issues including, but not limited to traffic, safety and road hazards, geometric issues, road shoulders, sidewalks, curb and gutters, drainage issues, or short-term maintenance that should be performed.

3 Network Summary

The County is responsible for maintaining 582.8 centerline miles of roadways, which includes 38.9 centerline miles of arterials, 227.6 centerline miles of collectors, 307.5 centerline miles of residential roads. The network is composed primarily of asphalt concrete (AC) pavement sections with 13 Portland Cement Concrete (PCC) sections (5 centerline miles), 15 composite (AC over PCC) sections (7 centerline miles) and 8 surface treated (ST) sections (5.6 centerline miles). Tables 1 and 2 summarize the road network by functional class and by district, respectively.

Appendix E lists all the roads within the network, providing details such as the road name, beginning and ending crossroads, surface type, functional classification, inspection date, and the inspected PCI.

Table 1. Network Summary Statistics by Functional Class.

Functional Class	Centerline Mileage	Percent Area of Paved Network	Weighted Average PCI ¹	Condition
Arterial	38.9	10.9%	69	Fair
Collector	227.6	39.5%	61	Fair
Residential	307.5	49.6%	51	Fair
County Maintained Total Paved Roads	574	100.0%	57	Fair
Gravel	8.8	-	-	-
County Maintained Total Roads	582.8	-	57	Fair

¹The weighted average PCI is calculated by multiplying the area of each paved road section by the PCI of that section, totaling all sections together, and then dividing by the total area of the network area or functional classification.

Table 2. Network Summary Statistics by Supervisor District.

Supervisor District	Centerline Mileage	Lane Mileage	Total Area, SF	% by Centerline Miles
District 1	161.7	334	22,246,037	28%
District 2	175.1	353	24,791,681	30%
District 3	57.6	115	6,924,245	10%
District 4	45.5	92	5,802,849	8%
District 5	142.9	289	16,466,751	24%
Total	582.8	1,183	76,231,563	100.0%

Pavements are one of the County's most valuable assets. The total road network replacement cost is estimated to be approximately \$989.8 million. This can be viewed as the value of the pavement network and is the amount needed to fund a reconstruction of the entire paved network. The replacement cost is calculated by multiplying the total pavement area by the unit cost of reconstruction of the pavement structure. It does not include related infrastructure assets such as sidewalks, signals, markings, signs, or storm drains.

4 **Pavement Condition**

The PCI is a measurement of pavement grade or condition and ranges from 0 to 100. A newly constructed road will have a PCI of 100, while a road in very poor condition will have a PCI of 24 or less. Pavement conditions are primarily affected by climate, traffic loads and volumes, construction materials, and age. The distress might include:

Asphalt Pavement	Concrete Pavement
• Alligator (Fatigue) Cracking • Block Cracking • Distortions • Longitudinal and Transverse Cracking • Patch and Utility Cut Patch • Rutting/Depression • Raveling • Weathering	• Corner Break • Faulting • Linear Cracking • Scaling • Spalling • Patching

The photographs in Figure 2 illustrate examples of asphalt concrete roads with different PCI ranges.

COMPASS CT- PCI 47

BUCK CT- PCI 7

Figure 2. Examples of Roads with Different PCIs.

The definitions of the pavement condition categories and PCI ranges are shown in Table 3. These are the PCI “breakpoints” in StreetSaver®.

Table 3. Pavement Condition Categories.

Condition Category	PCI Range	Description
Good (I)	70 – 100	Pavements with minimal surface distress that may include some hairline longitudinal/transverse cracks and/or weathering. The pavement structure is sound, and minor oxidation may occur.
Fair (II/III)	50 – 69	Pavements with significant distress that is predominantly non-load-related for Category II, such as longitudinal/transverse cracks, bleeding, block cracking, weathering, raveling, etc. The pavement structure is sound, and some oxidation has occurred. For Category III, some load-related distresses are evident with low to medium alligator cracking, localized rutting, etc.
Poor (IV)	25 – 49	Pavements with moderate to severe surface distresses. Extensive weathering or raveling, block cracking, and load-related distresses such as alligator cracking, rutting, and potholes may occur.
Very Poor (V)	0 – 24	Pavements with severe weather-related distress and large quantities of load-related distress. These pavements are nearing the end of their service life.

4.1 County’s Current Pavement Condition

The County’s current overall weighted average PCI for the network is 57, which places the overall road network pavement condition in the “Fair” category. Figure 3 shows the PCI conditions for roads with different functional classifications. Road condition assessments by functional class indicate that 29.5 percent of the pavement network is in “Good” condition with 31.8 percent in “Fair”, 35 percent in “Poor” and only 3.7 percent in “Very Poor” conditions.

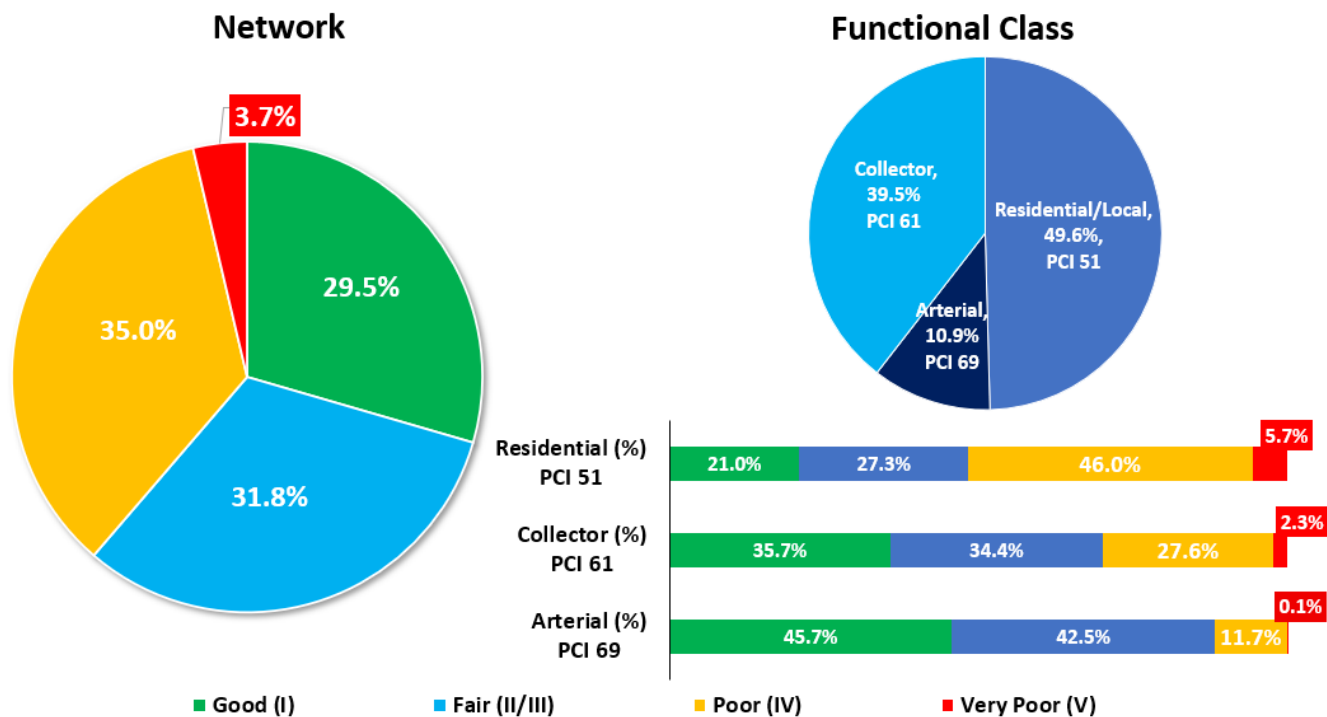

Figure 3. Road Network Percent Pavement Area by Condition Category.

Please note that the last inspection was conducted in May 2018 using walking survey procedure and the PCI was reported to be 48 in the 2019 report. The overall network PCI increased 9 points since 2019 due to the following reasons:

- About 15 percent of the network, totaling approximately 273.6 lane-miles, received either rehabilitation or surface seal treatments (Figure 4). By restoring a large segment of the roadway system, these efforts directly moved many sections into higher PCI scoring categories.
- Approximately 84 sections received repairs including lane replacement, utility patch and pothole fixing which were not part of planned annual treatment (Figure 5). The estimated value for these repairs would be approximately \$3M, which was not a part of the annual existing budget. By quickly eliminating localized distresses, this work produced an immediate boost in PCI for the treated areas.
- The overall increase in network PCI is largely due to the change from a 10% sampled walking survey to a 100% coverage automated survey. The automated method captures more detailed and continuous pavement data, including localized areas in good condition that were previously unrecorded. Under the walking survey approach, approximately 10% of each pavement section was visually inspected and rated, and those sampled segments were used to represent the entire network condition. This limited sampling approach can miss localized variations, especially in rural or low-volume areas where pavement conditions may differ significantly within a single section. In contrast, the automated survey method provides continuous, 100% coverage of the roadway network using high-resolution imaging and laser-based distress detection. This enhanced data density captures finer surface details and localized

improvements that may not have been reflected in prior 10% sampling assessments. As a result, the network-wide PCI appears higher due to a more comprehensive and accurate representation of pavement condition rather than an actual improvement in field performance.

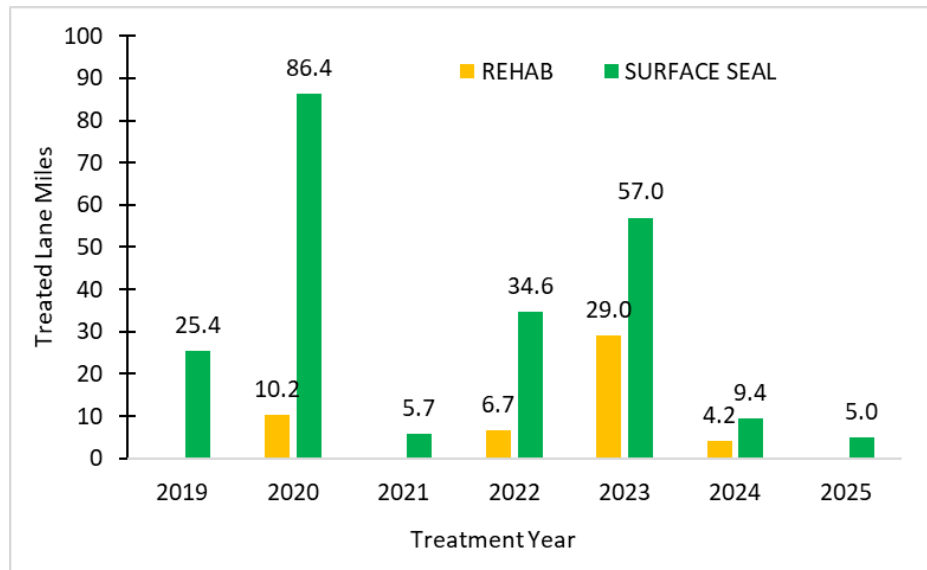

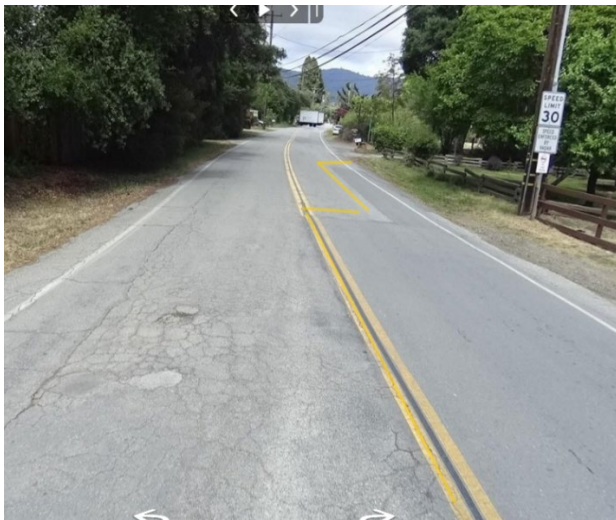

Figure 4. Treated Lane-Miles After 2018/19 PMP Update

BROWNS VALLEY RD between AMESTI RD and 1.0 MI N/AMESTI RD

CABRILLO COLLEGE DR between PARK AV and 88' E/O PARK AV

Figure 5. Localized Repairs

Therefore, the combination of rehabilitation, preventive maintenance, localized treatments, and switching from walking survey to automated survey support the increase in the overall weighted PCI score for the network.

4.2 PCI Comparison with Neighboring Agencies

Figure 6 shows the County’s average network PCI compared to neighboring agencies as well as the statewide average PCI from the 2022 California Statewide Local Roads and Roads Needs Assessment⁵. The County’s PCI of 57 positions the County 8 points below the 2022 statewide average of 65.

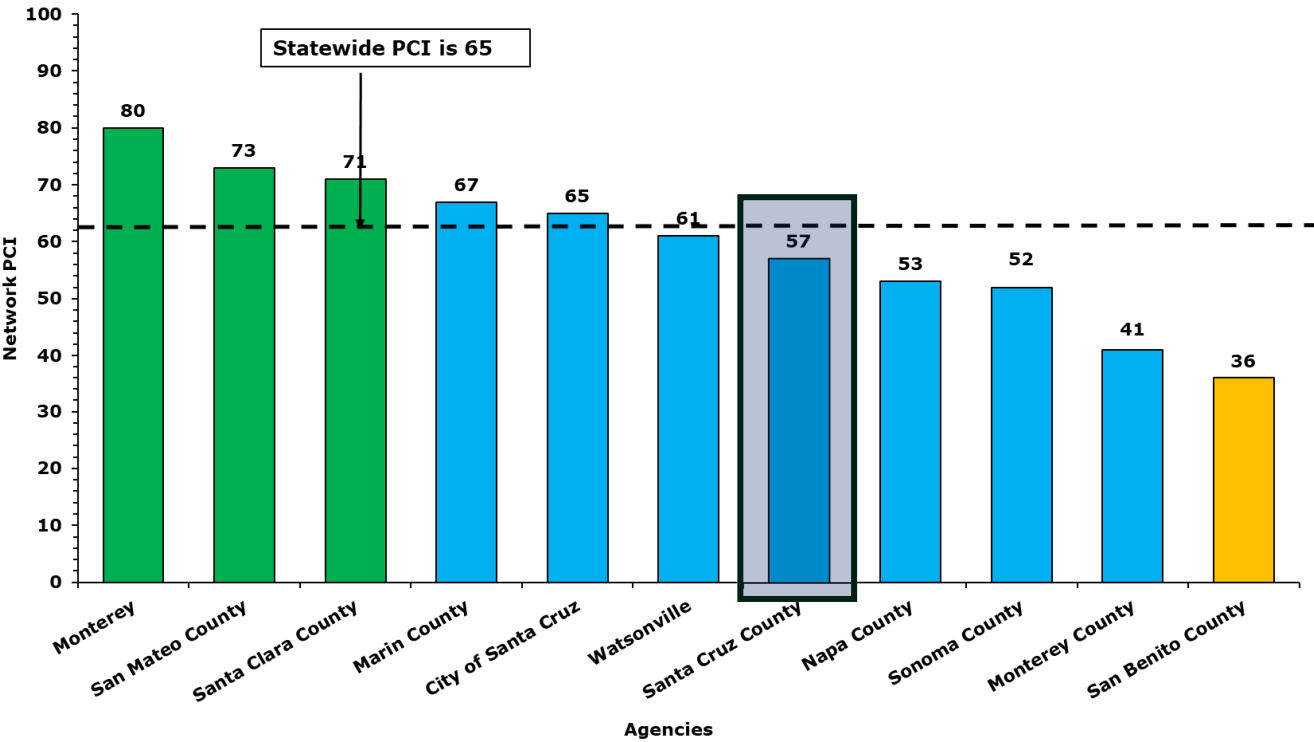

Figure 6. Network PCI for Different Agencies.

⁵ “California Statewide Local Roads and Roads Needs Assessment 2022 Update”. Nichols Consulting Engineers, Chtd., CA, 2022.

5 Maintenance and Rehabilitation Strategies

In general, surface treatments such as crack seals or slurry seals are used when the pavements are in “Fair” to “Good” condition. This type of treatment is usually considered “preventive maintenance”. When the pavement condition deteriorates to lower levels, overlays and full-depth structure replacements must be performed. These are considered “rehabilitation” or “reconstruction”. In addition, base repairs for more localized distresses are commonly done in preparation for overlay and surface seal treatments.

Based on a discussion with County staff, a detailed M&R decision tree was prepared and is included in Appendix B. Figure 7 presents the decision tree of arterials for example. This determined the most effective and realistic treatments for each group of roads by functional class and condition category.

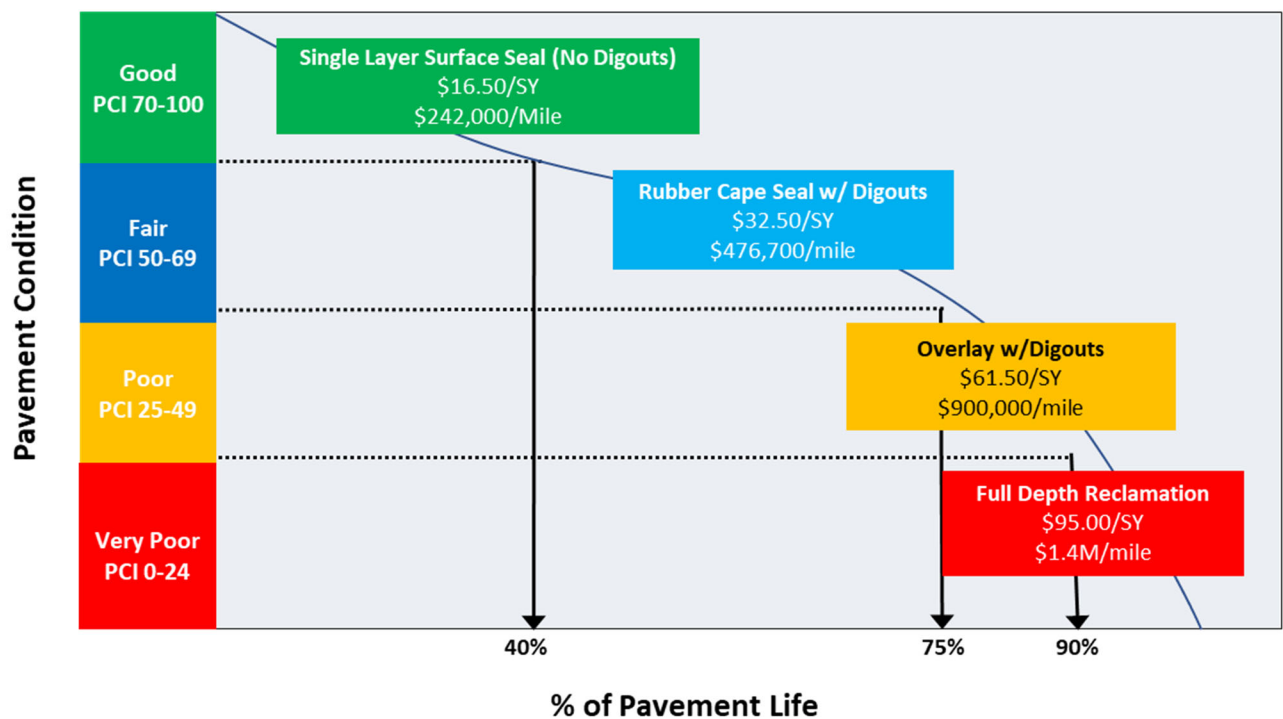

Figure 7. Costs⁶ of Maintaining Arterial over Service Life.

5.1 Impact of Pavement Condition on Treatment Cost

Figure 7 illustrates how costs of pavement treatment increase as pavement conditions decrease over time. The dollar amounts shown in Figure 7 are based on recent bids received from Santa Cruz County and illustrate that it costs much less to maintain roads in good condition than to repair failed roads. By letting pavements deteriorate, roads that cost about \$18.00 per square yard to treat with slurry seal, in a few years, would cost about \$95.00 per square yard to reconstruct. Note that a slurry seal can be applied on approximately 5 times as many lane miles for the cost that is required to reconstruct pavements in failed condition.

⁶ In addition to the contractor’s prices, unit costs are loaded to include staff time, design, construction management, contingencies, and non-asphalt concrete related work.

Because of this, a key pavement management repair strategy is to keep roads in “Good” to “Fair” condition from deteriorating. This is particularly true for roads in the “Fair” range since pavement deterioration will accelerate if left untreated. Pavements in “Fair” condition show some distress and require repairs beyond preventive maintenance. At this point, a well-designed pavement will have reached between 35 and 50 percent of its life, a 2-inch mill and overlay would be required to bring its condition back to “Good.” For pavements in the “Poor” category, approximately 30 percent of service life is left, and a thicker grind with overlay (2.5-inch) would be required to bring its condition back to “Good”. Pavements in “Very Poor” condition are near the ends of their service lives and often exhibit severe forms of distress such as potholes, rutting, and extensive cracking. At this stage, reconstruction is typically required. In general, major roads are expected to have a service life of approximately 25 years, while residential roads are expected to have a service life exceeding 30 years.

5.2 Impact of Analysis Period over Treatment Cost

County’s last PMP update was conducted in 2018. The COVID-19 pandemic in 2021 disrupted supply chains and labor markets, sending U.S. inflation from just 1.2 percent in 2020 up to 4.7 percent in 2021 and peaking at 8.0 percent in 2022. Since then, inflation has begun to moderate, hovering around 3.9 percent in mid-2024—high enough to reflect ongoing price pressures but low enough to suggest more stable growth ahead.

In the 2018/19 Pavement Management Program (PMP) report, NCE modeled a steady 3.0 percent annual inflation rate across all budget scenarios. Under that assumption, the cost of hot mix asphalt (HMA) would have risen from about \$130 per ton in 2018 to roughly \$160 per ton by 2025. According to recent bid tabs obtained from the County, HMA prices have climbed to nearly \$200 per ton—a 7.7 percent average annual increase—far outstripping original projections from the last update. This unit cost was derived through an analysis of recent awarded bid tabs from County public works projects.

Over the same period, rates of other paving items have increased as shown in Table 4 below. It summarizes the unit price of common paving items from the last 2018/19 PMP and 2024 Decision Tree Update report, compared to the 2025-unit prices.

Table 4. Paving Items Unit Price 2018 – 2025.

Item	Unit	Unit Cost 2018	Unit Cost 2025	% Total Increase	% Annual Increase	Data From
½" HMA Type A	Ton	\$130	\$200	53.8%	7.7%	Bid Tabs
4" Base Repairs/Digouts	Square Foot	\$4.50	\$9.00	100%	14.3%	Bid Tabs
Cold Milling (1.5"-2")	Square Yard	\$2.25	\$5.00	122.2%	17.5%	Bid Tabs
Asphalt Rubber Cape Seal	Square Yard	\$8.50	\$10.50	23.5%	3.4%	Bid Tabs

6 Budget Analysis

Based on the principle that it costs less to maintain roads in good condition than it does to repair those that have failed, cost-effective PMPs employ strategies that first eliminate deferred maintenance and then preserve the network with ongoing preventive maintenance. Such strategies bring the network condition to an optimal PCI that can be maintained over time.

6.1 Budget Needs

The first step in developing a cost-effective strategy is to determine, assuming an unconstrained budget, the total maintenance budget “needs” of the network, i.e., the funding required for every road in the network to reach optimal conditions based on the policy established in the decision tree. For the County, the cost of treatment(s) over the analysis period was calculated by multiplying unit costs by pavement section area at an annual inflation rate of 3.5 percent over a 10-year analysis period.

The budget needs are estimated to be approximately \$613.8 million over the next 10 years. Of the total budget needs, approximately \$502.7 million (82 percent) would be devoted to rehabilitation, while the rest would be allocated for preventive maintenance. If the County follows this “ideal” strategy, the average network PCI will increase to 77 in FY25/26 and maintain at low 70s by FY 34/35. Table 5 below shows the impacts of expenditure on the PCI, assuming a front-loaded unconstrained budget. Appendix C presents the following information regarding the budget needs: projected PCI, cost summary, and a summary of the preventive and rehabilitation maintenance treatments.

Table 5. Budget Needs of the Entire Network.

Fiscal Year	Current	25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	Total
Total Budget Needs (\$M)	NA	293.7	10.7	12.5	3.9	3.6	98.7	8.9	170.7	5.7	5.4	613.8
Treated PCI	57	77	74	73	71	69	71	70	74	72	71	NA
Untreated PCI		55	54	51	48	46	43	40	37	34	32	NA

6.2 Budget Scenarios

Having determined the road network's maintenance needs, the next step in developing a cost-effective M&R strategy is to generate several alternative budgets and analyze “what-if” scenarios. By examining the impacts of budget scenarios, the advantages and disadvantages of the 4 funding levels and maintenance strategies can be illustrated.

The budgeted amounts for the 4 scenarios (noted below) include an inflation factor of 3.5 percent over a 10-year analysis period. They also include paving as well as general construction items such as mobilization and striping, along with staff time, design, construction management, and contingencies.

- Scenario 1: County's Existing Budget (\$5.5M/year)
- Scenario 2: Maintain Network PCI at 57 (\$29.5M/year)
- Scenario 3: Improve Network PCI to 70 (\$49.1M/year)
- Scenario 4: Major Roads (Improve PCI to 70) and Local Roads (Do Nothing) (\$22.0M/year)

6.2.1 Scenario 1: County’s Existing Budget (\$5.5M/year)

At the County’s anticipated budget of \$5.5 million every year, the network PCI will decrease from 57 to 36 by FY 34/35. An average of 8.6 percent was allocated for preventive maintenance. By the end of the analysis period, 18.7 percent of the network will be in “Good” condition and 43.7 percent will be in “Very Poor” condition. The deferred maintenance cost will increase from \$293.7 million to \$682.9 million by FY 34/35. Table 6 and Figure 8 show the outcomes under this scenario.

Table 6. Cost Summary for Scenario 1.

Fiscal Year	Current	25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	Total
County’s Budget (\$M)	N/A	5.5	5.5	5.5	5.5	5.5	5.5	5.5	5.5	5.5	5.5	55.0
Deferred Maintenance (\$M)	293.7	288.2	327.0	372.5	418.0	456.4	506.1	548.4	591.8	638.6	682.9	N/A
Network PCI	57	57	54	52	50	48	45	43	40	38	36	N/A

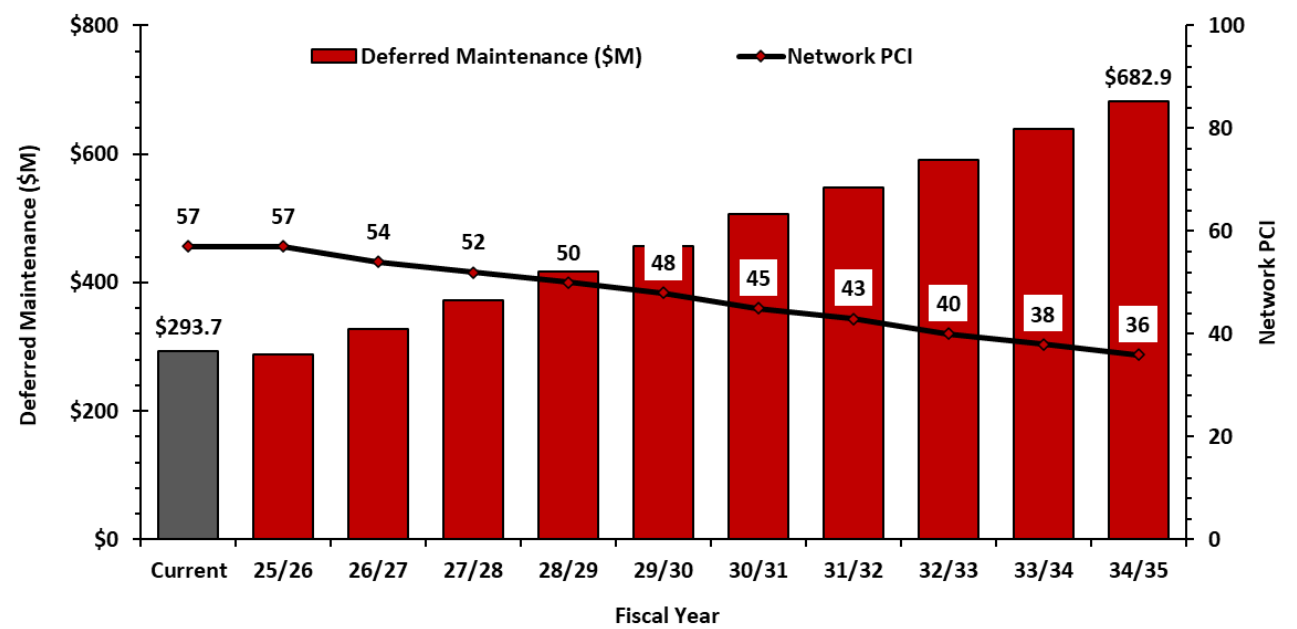

Figure 8. PCI versus Deferred Maintenance for Scenario 1.

6.2.2 Scenario 2: Maintain Network PCI at 57 (\$29.5/year)

This scenario aims to maintain the current PCI at 57 throughout the analysis period. As shown in Table 7 and Figure 9, the estimated financial commitment required to accomplish this goal is \$294.5 million over 10 years. Scenario 2 allocates 4.6 percent of the budget towards preventive maintenance (“Good” condition), resulting in deferred maintenance costs of \$401.2 million by FY 34/35. In this scenario, 52.6 percent of the network will be in “Good” condition with 23.3 percent in “Very Poor” condition at the end of the 10-year period.

Table 7. Cost Summary for Scenario 2.

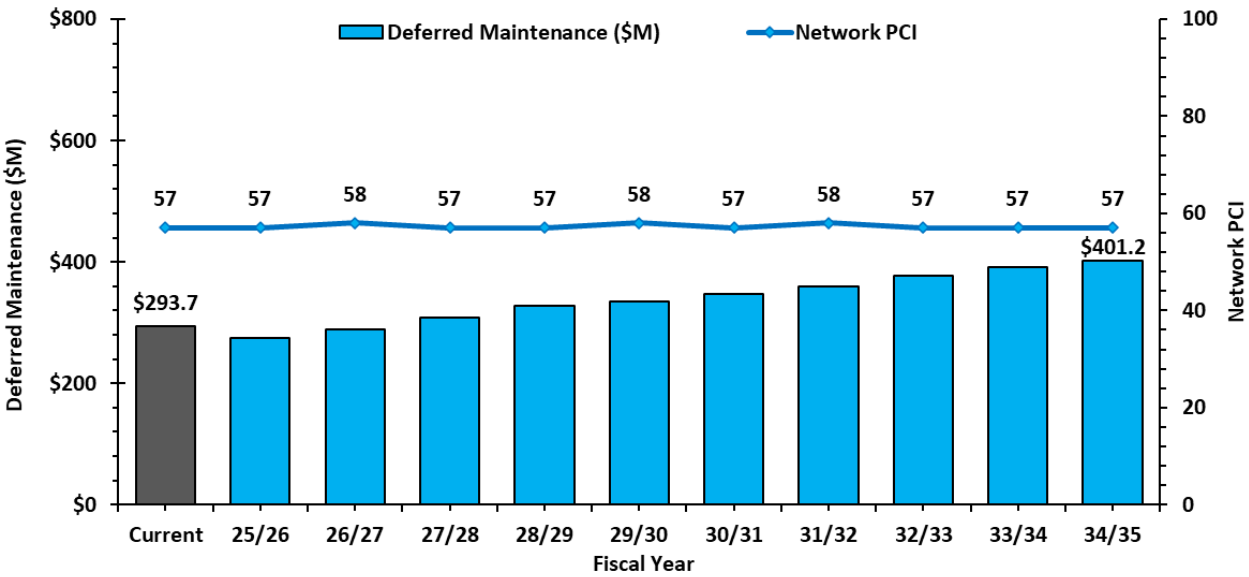

Figure 9. PCI versus Deferred Maintenance for Scenario 2.

6.2.3 Scenario 3: Improve Network PCI to 70 (\$49.1M/year)

This scenario aims to improve network PCI to 70 by the end of FY 34/35. As shown in Table 8 and Figure 10, the estimated financial commitment required to accomplish this goal is \$490.8 million over 10 years. Scenario 3 allocates 21.2 percent of the budget towards preventive maintenance (“Good” condition), resulting in deferred maintenance costs of \$197.5 million by FY 34/35. In this scenario, 71.5 percent of the network will be in “Good” condition with 10.9 percent in “Very Poor” condition at the end of the 10-year period.

Table 8. Cost Summary for Scenario 3

Fiscal Year	Current	25/26*	26/27*	27/28*	28/29	29/30	30/31	31/32	32/33	33/34	34/35	Total
County’s Budget (\$M)	N/A	23.3	42.4	47.0	54.5	56.9	48.7	48.6	54.1	51.6	63.7	490.8

*Includes County’s Planned Projects

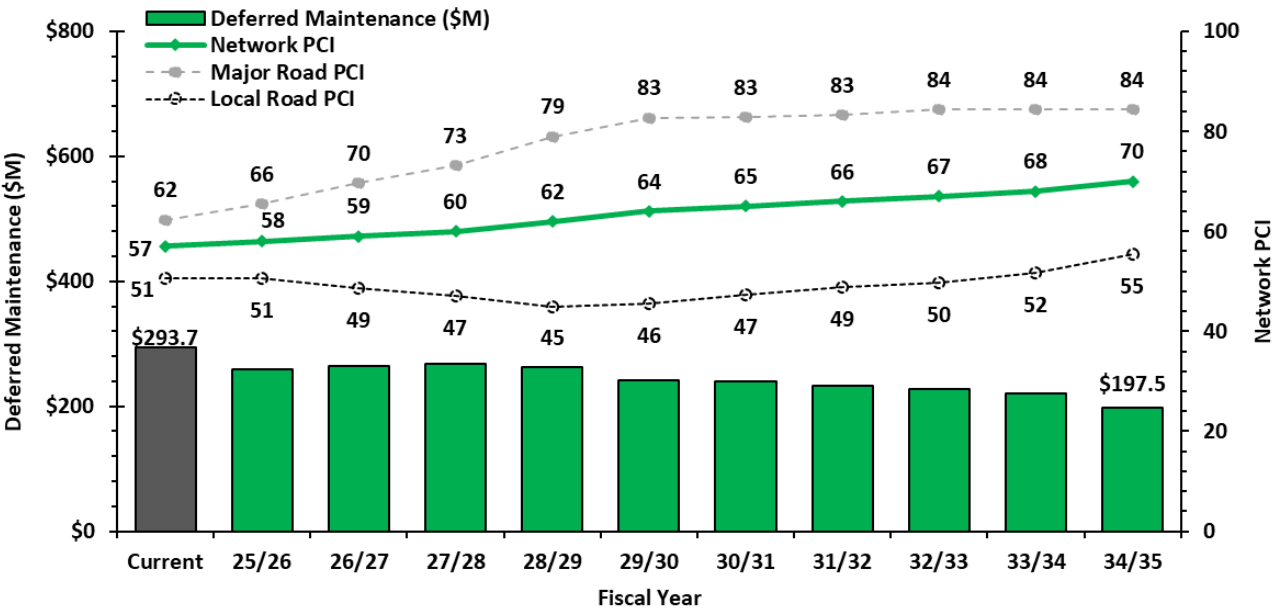

Figure 10. PCI versus Deferred Maintenance for Scenario 3.

6.2.4 Scenario 4: Major Road (Improve PCI to 70) and Local Road (Do Nothing) (\$22M/year)

This scenario aims to only focus on the major roads and assumes no budget is available for the local roads. The goal is to improve the PCI of the arterials and collectors to 70 by FY 34/35. At the same time, the local roads PCI will drop to 29, resulting in an average network PCI of 50 by FY 34/35. As shown in Table 9 and Figure 11, the estimated financial commitment required to accomplish this goal is \$220.2 million over 10 years. Scenario 4 allocates approximately 16 percent of the budget towards preventive maintenance (“Good” condition), resulting in deferred maintenance costs of \$482.9 million by FY 34/35. In this scenario, 41.4 percent of the network will be in “Good” condition with 32.6 percent in “Very Poor” condition at the end of the 10-year period.

Table 9. Cost Summary for Scenario 4

Fiscal Year	Current	25/26*	26/27*	27/28*	28/29	29/30	30/31	31/32	32/33	33/34	34/35	Total

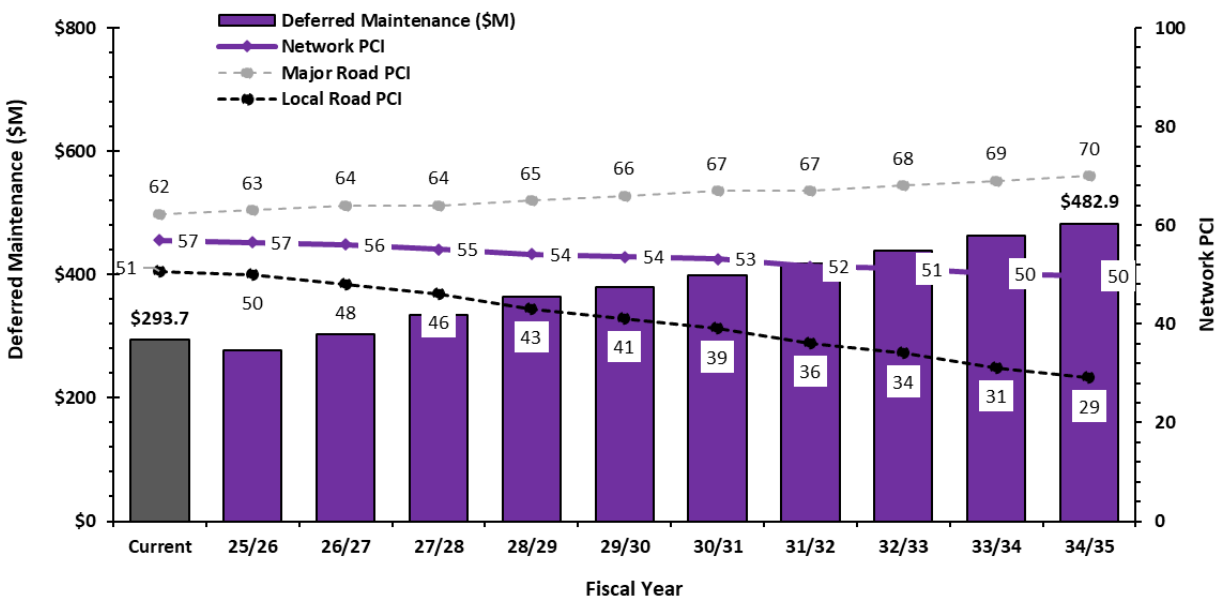

Figure 11. PCI versus Deferred Maintenance for Scenario 4.

6.3 Scenario Summary and Comparisons

-  **Scenario 1: County’s Existing Budget (\$5.5 M/year)** – The network PCI is projected to decrease from 57 to 36 by the end of the 10-year analysis period. The cost of deferred maintenance⁷ will increase from \$293.7 million to \$682.9 million by FY 34/35.
-  **Scenario 2: Maintain Network PCI at 57 (\$29.5 M/year)** – The aim of this scenario is to maintain network PCI at 57 for next 10-years. This will cost a total of \$294.5 million over 10 years, increasing the deferred maintenance to \$401.2 million by FY 34/35.
-  **Scenario 3: Improve Network PCI to 70 (\$49.1 M/year)-** The aim of this scenario is to improve the network PCI to 70 by the end of FY 34/35. This will cost a total of \$490.8 million over 10 years, decreasing the deferred maintenance to \$197.5 million by FY 34/35.
-  **Scenario 4: Major Roads (Improve PCI to 70) and Local Roads (Do Nothing) (\$22.0 M/year)–** This scenario aims to focus only on major roads and improve current PCI to 70 by end of FY 34/35. No budget is available on County’s maintained local roads. The projected PCI of local roads will keep deteriorating to 29 by the end of FY 34/35. The overall network PCI will drop from 57 to 50. This will cost a total of \$220.2 million over 10 years, increasing the deferred maintenance to \$482.9 million by FY 34/35.

Table 10 summarizes each scenario and its corresponding 10-year budget, PCI, and deferred maintenance costs at the end of the analysis period. Appendix D shows the cost and network condition summary for each scenario, Appendix A presents maps for the current PCI conditions in FY 25/26 and after treatment in FY 34/35 for each scenario.

Table 10. Budget Scenario Analysis Summary.

Scenario	Description	Cumulative 10-year Budget (\$M)	End of FY 34/35	
			Network PCI	Deferred Maintenance (\$B)
1	County’s Existing Budget	55.0	36	682.9
2	Maintain Network PCI at 57	294.5	57	401.2
3	Improve Network PCI to 70	490.8	70	197.5
4	Major Road (Improve PCI to 70) and Local Road (Do Nothing)	220.2	50	482.9

Figure 12 compares the annual changes in PCI under each budget scenario, and Figure 13 illustrates the associated annual changes in deferred maintenance under each budget scenario. Under Scenarios 1 and 4, the projected PCI is expected to decrease to 36 and 50, respectively. Under Scenario 2, the PCI is expected to be

⁷ Deferred maintenance refers to maintenance activities that were either not performed as scheduled or were postponed to a future period due to insufficient funding. This calculation encompasses costs associated with CICM (Construction Inspection and Construction Management), design, and contingencies.

maintained at the current level while it is expected to increase to 70 under Scenario 3 (Figure 12). In addition, as seen in Figure 13, deferred maintenance is projected to increase under all scenarios except for Scenario 3.

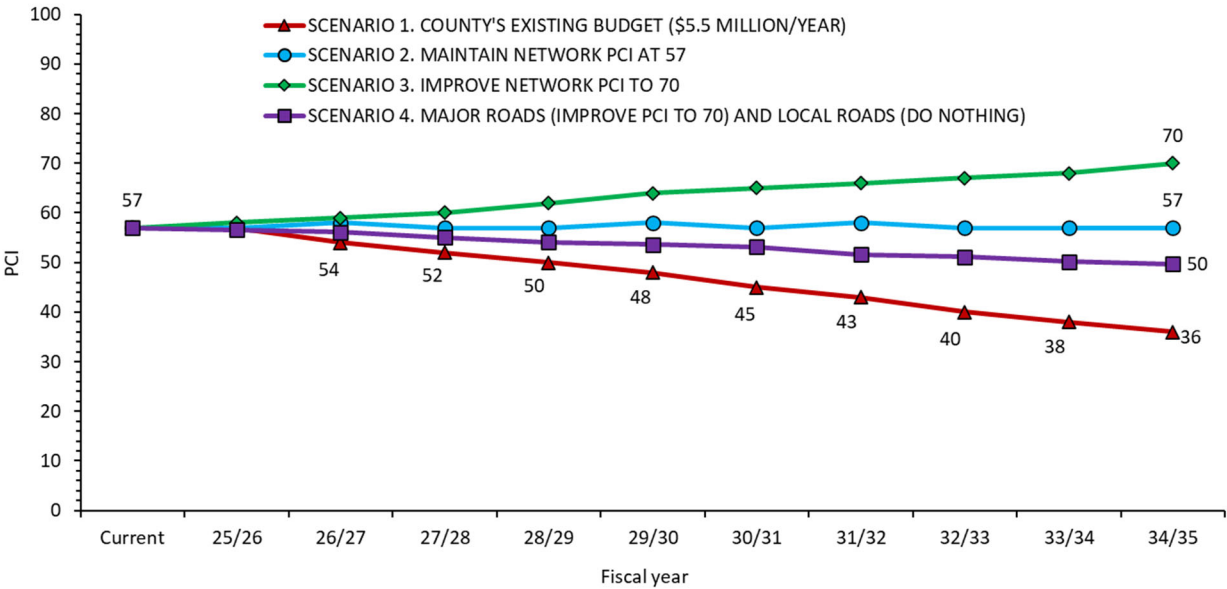

Figure 12. Comparison of Annual PCI by Scenario.

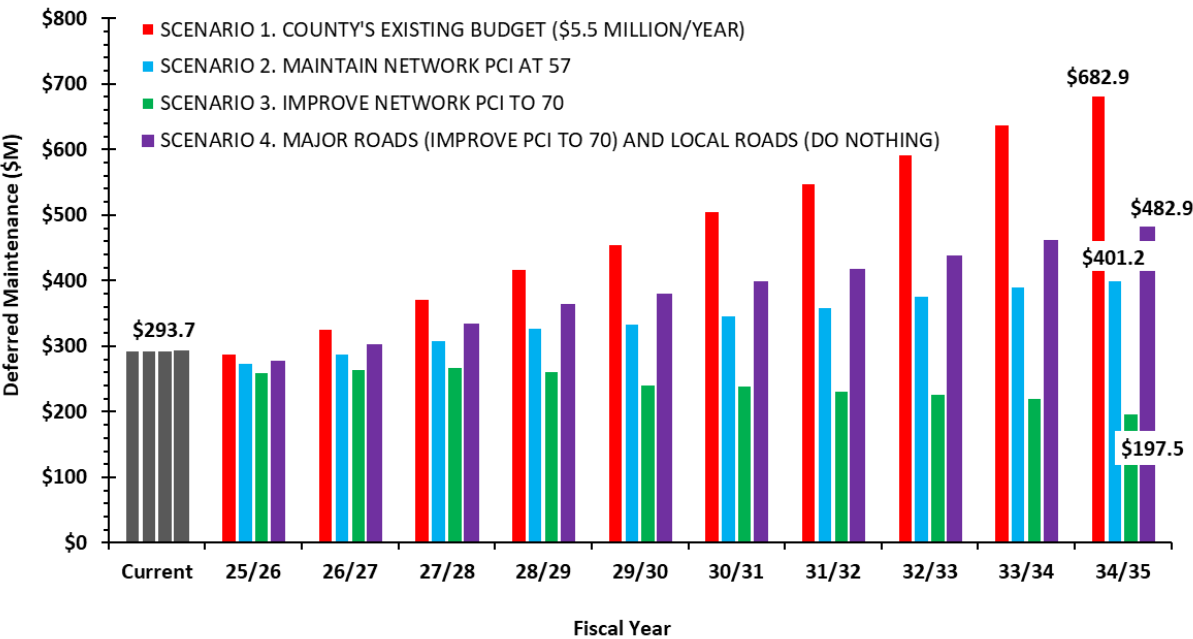

Figure 13. Comparison of Annual Deferred Maintenance by Scenario.

Figure 14 illustrates the percent change in pavement condition for each scenario at the end of FY 34/35. The portion of the network in “Good” condition will decrease and the portion of the network in “Very Poor” condition will significantly increase under Scenario 1. The portion of the network in “Good” condition will increase under Scenarios 2, 3 and 4.

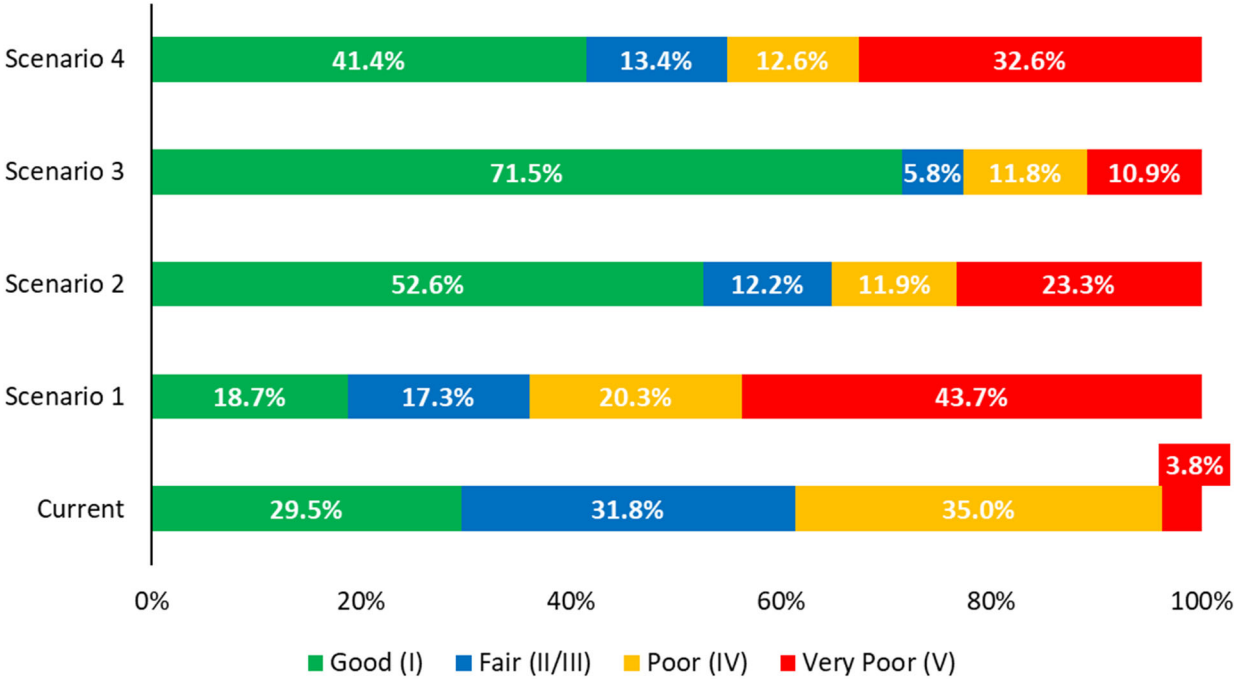

Figure 14. Comparison of Pavement Condition by FY 34/35 by Scenarios.

It is important to note that to improve the network condition and reduce the deferred maintenance, the County will need to increase the annual budget significantly. Scenario 3 will require an additional average of \$43.6 million every year, compared to Scenario 1(existing budget \$5.5 million per year).

7 Conclusions and Recommendations

The Santa Cruz County has made a substantial investment of \$989.8 million in its pavement network. Overall, the pavement network is in the “Fair” condition with a PCI of 57. The County’s existing budget (Scenario 1) of \$55 million over 10 years is expected to reduce the overall network PCI from 57 to 36. Under Scenario 2, PCI would be maintained at 57 with an investment of \$294.5 million. Scenario 3 requires a total of \$490.8 million over 10-years to improve the network PCI from 57 to 70 (“Good” Condition). Scenario 4 would only improve the PCI of major roads to 70 with an investment of \$220.2 million over 10-years which would bring down the overall network PCI from 57 to 50.

7.1 Recommendations

NCE recommends that the County increase the funding level to improve the network condition and decrease deferred maintenance. Scenario 3 accomplishes both of these objectives by increasing PCI from 57 to 70 and decreasing the current deferred maintenance from \$293.7 million to \$197.5 million by the end of FY 34/35. However, if the County determines that Scenario 3 is unrealistic to implement due to significant financial commitment, **NCE recommends that the County pursue Scenario 2 for a few years, while seeking new funding sources to improve the PCI to 70, and maintain the overall network in “Fair” condition.** The County should consider the following which would help implement the recommended scenario:

1. **Additional Funding** – Actively pursue additional pavement funding sources to fill the gap between the County’s existing funding and Scenario 3. Here are some potential sources of funding the County can pursue:

Federal Funding Sources

- Regional Surface Transportation Program (RSTP)
- Surface Transportation Program (STP)
- Congestion Mitigation and Air Quality Improvement Program (CMAQ)
- Community Development Block Grant (CDBG)
- Highway Safety Improvement Program (HSIP)
- Federal Emergency Management Agency (FEMA)
- Transportation Enhancement Activities (TEA)

State Funding Sources

- Active Transportation Program (ATP) which now includes the Bicycle Transportation Account (BTA) and Safe Routes to Schools (SR2S)
- State Transportation Improvement Program (STIP)
- AB 2766 (vehicle surcharge)
- Vehicle License Fees (VLF)
- CalRecycle grants
- State Water Resource Control Board

- Transportation Development Act (TDA)
- Traffic Safety Fund
- Transportation Uniform Mitigation Fee (TUMF)

Local/Regional Funding Sources

- Development impact fees
 - General funds
 - Various assessment districts – lighting, maintenance, flood control, special assessments, community facility districts
 - Traffic impact fees
 - Utilities; e.g., stormwater, water, wastewater enterprise funds
 - Parcel/property taxes
 - Vehicle registration fees
 - Vehicle code fines
 - Transient Occupancy Taxes
2. **Pavement Maintenance Strategies** – Continue with a well-funded preventive maintenance program to preserve the good roads in “Good or Fair” condition and rehabilitation projects to improve pavements in poor condition. This is necessary to maintain at least the portion of the road network in “Fair” condition and avoid increasing the deferred maintenance.
 3. **Inspection Strategies** – Monitor future pavement performance and ongoing maintenance needs by updating the required inventory of the County’s major roads (arterials and collectors) every 2 to 3 years at a minimum. NCE recommends that the County also inspect the residential road network every 4 to 5 years.
 4. **M&R Decision Tree** – Review and update the M&R treatment strategies and associated unit costs annually to reflect new construction techniques and costs so that the budget analysis results remain reliable and accurate.

Maintenance and Rehabilitation (M&R) Decision Tree

Maintenance and Rehabilitation (M&R) Decision Tree

This report presents the current maintenance and rehabilitation decision tree that exists in the database. The decision tree forms the basis for all of the budgetary computations included in this report. ***Changes to the decision tree will make the results in the budget reports invalid.*** All pavement treatment unit costs relevant to the road types in the database were updated.

The decision tree lists the treatments and costs selected for preventive maintenance and rehabilitation activities. Each line represents a specific combination of functional classification and surface type.

The preventive maintenance portion of the report is identified as Condition Category I – Very Good. All preventive maintenance treatment listings are assigned only to sections in Condition Category I where the $PCI \geq 70$. Sections with PCI values less than 70 are assigned to treatments listed in Categories II through V.

In the preventive maintenance category ($PCI \geq 70$), a time sequence is used to identify the appropriate treatment and cost. Each preventive maintenance treatment description consists of three parts: 1) a CRACK treatment, 2) a SURFACE treatment, and 3) a RESTORATION treatment. These three parts allow the user to specify one of three different preventive maintenance treatments depending on the prior maintenance history of the section.

1. The CRACK treatment part can be used to specify the most frequent type of preventive maintenance activity planned (typically crack seals).
2. The SURFACE treatment part can be used to specify more extensive and less frequent preventive maintenance activities, such as chip seals or slurry seals. For example, a crack seal can be specified on a 3-year cycle with a slurry seal specified after 5 years.
3. The RESTORATION part can be used to specify a surface restoration treatment (such as an overlay) to be performed after a specified number of surface treatments. For example, after a certain number of successive slurry seals, an overlay can be specified instead of another slurry seal.

Rehabilitation treatments are assigned to sections in Condition Categories II through V (PCI less than 70). Each line is defined by a specific combination of functional classification, surface type, and condition category.

COLUMN	DESCRIPTION
Functional Class	Functional Classification identifying the branch
Surface	Surface Type identifying the branch number.
Condition Category	Condition Category (I through V).
Treatment Type	First Row (Crack Treatment) indicates localized treatment (e.g., crack sealing). Second Row (Surface Treatment) indicates surface treatment (e.g., slurry sealing). Third Row (Restoration Treatment) indicates surface restoration (e.g., overlay).
Treatment	Name of treatments from the "Treatment Descriptions" report.
Yrs. Between Crack Seals	First Row - number of years between successive treatment applications specified in the first row (i.e., CRACK treatment).
Yrs. Between Surface Seals	Second Row - number of years between successive treatment applications specified in the second row (i.e., SURFACE treatment).
Number of Sequential Seals	Number of times that the treatment application in the second row (i.e., SURFACE treatment) will be performed prior to performing the treatment application in the third row.

Note that the treatments assigned to each section should not be blindly followed in preparing a road maintenance program. Engineering judgment and project level analysis should be applied to ensure that the treatment is appropriate and cost effective for the section.

Appendix C

Budget Needs

Budget Needs Reports

The purpose of this section is to answer the question: *If the City had all the money in the world, what sections should be fixed and how much will it cost?* Based on the Maintenance & Rehabilitation (M&R) decision tree and the PCIs of the sections, the program will then select a maintenance or rehabilitation action and compute the total costs over a period of ten years. The Budget Needs represents the "ideal world" funding levels, while the Budget Scenario reports in the next section represent the most "cost effective" prioritization possible for the actual funding levels.

A budget needs analysis has been performed. The summary results from the analysis are shown below. An interest rate of 3% and an inflation factor of 3% were used to project the costs for the next ten years. This report shows the total ten-year budget that would be required to meet the City's standards as exemplified in the M&R decision tree.

Budget Needs reports included in this appendix are listed below:

- Projected PCI/Cost Summary
- Preventive Maintenance Treatment/Cost Summary
- Rehabilitation Treatment/Cost Summary

Section Description Inventory – Average (Weighted by Area) PCI

Section Description Inventory Report

This report lists a variety of section description information for each of the County's street pavement sections. It lists the street and section identifiers, limits, functional class (FC), surface type, number of lanes, lengths, widths, and inspected PCI.

All of the City's vehicular street sections are included in the report. The report is sorted alphabetically by Street Name and Section ID and by descending PCIs. The field descriptions in this report are listed on the next page.

Header	Description
Street ID	Street identification in StreetSaver® unique for each street
Street Name	The name of the street as indicated by street signs in the field
Section ID	Section identification number in StreetSaver® unique for each section of one street
Beg Location	Beginning limit of the section
End Location	Ending limit of the section
Functional Class	Functional Classification (A – Arterial, C – Collector, R – Residential)
Surface Type	Surface Type (AC = Asphalt Concrete, AC/AC = Asphalt Concrete Overlay of existing Asphalt Concrete, PCC = Portland Cement Concrete, AC/PCC = Asphalt Concrete Overlay of existing Portland Cement Concrete)
Lanes	Number of lanes of the section
Length (ft)	Length of the section in feet
Width (ft)	Average width of the section in feet
Area (sf)	Area of the section in square feet
PCI	Average Inspected PCI for the section
Condition Category	“Very Good” = PCI > 70, “Good” = PCI > 50 & < 70, “Poor” = PCI > 25 & < 50, “Very Poor” = PCI < 25
